

Ryan White Services Report (RSR) Data Completeness Rates, 2010-2022

Chart 1: Completeness Rates for Demographic Data Elements Remain High

Providers are reporting complete responses for key demographic data elements. Completeness has improved over the years to nearly 100% for HIV risk factor, housing status, health care coverage, and poverty level, and has been consistent over time.

Chart 2: Completeness Rates for Clinical Data Elements Have Improved Significantly

This chart shows that although providers initially struggled with reporting viral load test results, CD4 count test results, and prescription of ART, completeness rates from 2011 to 2022 have greatly improved and remained high. Clinical data reporting remained exactly the same in 2022 compared to 2021.
